

Chronic Infections and Illnesses

Heavy Metals and Toxicity

Metals are found naturally in our environment, and they are also essential to our body's proper functioning. However, high levels of metals in our body will lead to acute, and even chronic poisoning. It usually takes significant exposure to get severe symptoms and statistics show heavy metal poisoning is relatively rare in the United States, but on the other end of the spectrum, low-grade chronic exposure from things like poor diet, sluggish digestion, toxic environments, and sedentary lifestyles can still lead to a buildup of metals in the body. The accumulation can cause immune dysfunction, hormone imbalance, fatigue, brain fog, high blood pressure, and more. Many doctors don't normally test for heavy metals in the blood because they may not recognize the symptoms. If you are concerned about heavy metal toxicity, Health Partners LLC tests patients exhibiting signs and symptoms for heavy metal toxicity. Not only that, but our Providers will help to detox your body safely, and assist you in removing common triggers from your daily life that lead to accumulation.
